

ABSTRACT OF THE DISCLOSURE

A monitor with a first power port and a power line is connected to a power supply of a computer, so as to acquire direct current (DC) for the monitor to function. One end of the main body of the power line is installed with a first connector while the other end of the main body is installed with a second connector, and the first connector is electrically connected with the second connector via the main body. The power supply of the PC includes a second power port. When the first connector is plugged into the first power port and also the second connector is plugged into the second power port, the first power port can be electrically connected with the second power port via the power line, so as to have the monitor obtain the supply of the DC direct from the power supply of the computer.
